

COMING SOON!

ARC Manufacturing

NEW HYBRID RESISTANCE WELDER/DENT PULLER

ARC Manufacturing, the leader in D.C. welding technology has developed a patented series of hybrid resistance welder/dent pullers which operates on a combination of battery and transformer power. The welder can produce 10,000 electrode amps with 10 feet of cable reach. This unit also has a high duty cycle, but unlike inverter welders, this welder only requires 110 volt 20 amp power source. Along with up to 1000 lbs of electrode tip pressure, the weld nuggets measure 8.7mm on 3 + 3mm structural steel. This 4 cable system has a smart digital microprocessor which monitors the welder's performance at all times. ARC has pioneered innovative products like this and our "**Panel Beater**" line of spot welders, dent pullers and mig welders for the past 10 years. Ongoing research and development at ARC continues to provide the collision repair industry with the welding products needed for quality repairs in all shops at a price that is affordable.

Built in America.
